UAT: The New Paradigm

UAT (Unified Absolute Time)

It is important to always consider that analyzing UAT with the results from the Λ CDM model, which are **contaminated**, would yield erroneous results. We can evaluate Λ CDM with UAT, but not the other way around. You will find the reasons within the list of publications on **Zenodo**.

UAT emerges **without ad hoc** assumptions and in a natural way. It is born from a new temporal metric that considers time not as a metric, but as a **relationship**. Within this framework, **dark energy**, the **Hubble Tension**, and the **vacuum** emerge naturally.

UAT is not an extension of Λ CDM; it is a **completely independent new paradigm** from the current one.

For decades, the solution to the Hubble tension has been sought, something that current metrics could not resolve, and we have always looked in the wrong places, without realizing that the problem lay in their main foundations. We have become accustomed to patching things up with **magical solutions**. UAT tells us that the results coincide with observational data, but the price to pay is very high.

The question is, **are we willing to pay that price?**...
